(54) Title: A BLUETOOTH ADAPTOR

(57) Abstract: The present invention provides an adaptor, system and a method for allowing a communications device to accept a connection from a Bluetooth enable device. This is achieved by coupling the communications device to an adaptor which is configured to accept a Bluetooth connection from a Bluetooth enable device. The communications device periodically generates a connection request signal which is transferred to the adaptor. Once the Bluetooth connection has been established, the adaptor then establishes a connection with the communications device in response to a connection request signal. Communication can then be performed between the communications device and the Bluetooth enable device, with the communications device acting as a slave.
